

### Indications and Explicit Guidance for Soft Tissue Surgery Using Gait Analysis

Tom Novacheck, MD  
Jean Stout, PT, MS  
Adam Rozumalski, MS  
Michael Schwartz, Ph.D.

### Purpose

- Role of gait analysis in decision-making for soft tissue surgery in children with cerebral palsy
- Specific indications/contraindications for psoas, hamstring, and gastrocnemius procedures based on gait analysis data
- Surgical techniques
- Assessment of outcomes

### Outline

- |   |                   |
|---|-------------------|
| • Introduction                                | Novacheck         |
| • Previous Research<br>& Biomechanical Models | Rozumalski        |
| • Indications<br>(Physical Exam & Gait Data)  | Stout             |

| • Adverse Outcomes                            | Novacheck & Stout |
| • Discussion                                  |                   |

### A FEW CAVEATS

### Lack of explicit indications in the literature

a need for clarity and discussion

### Quantitative Gait Analysis

- Spasticity and contracture
  - manifest themselves when maximum *elongation rate* and *total length* attainment occur
- Critical to understand this timing

*Goals of lengthening  
musculo-tendinous contractures*

- The goal of muscle/tendon surgery is to allow the joints to achieve a normal joint position during gait without restriction.
- Why? If the length is restricted, compensatory movement patterns are required.

Caution!!

- **Musculo-tendinous units are the generators of the forces required**
  - propel body segments
  - exert the joint moments necessary to oppose gravitational forces
- *Carefully consider other potential causes of abnormal joint position to avoid lengthening a musculo-tendinous unit whose length is not restrictive!*

**Muscle length vs. tension curve**

in order for a muscle to function well on the length vs. tension curve, the muscle must be functioning at appropriate length with proper tension in the functional position of the joints and body segments.

*If this is not the case, then judicious muscle lengthening can be safe and appropriate.*

***Contraindications and complications of  
soft tissue surgery***

- A lack of recognition that contractures occur primarily due to the effects of **spasticity**.
  - Therefore, spasticity management should be the primary consideration.
  - While options were not available in the past, many are today.
  - Tendon surgery should be deferred as much as possible.

***Contraindications and complications of  
soft tissue surgery***

- Inappropriate surgical indications due to ***misconceptions*** regarding the cause of gait pathology.
  - Adductor lengthening for scissoring gait is a good example.
  - The adductors have been inappropriately blamed for scissoring gait.

***Contraindications and complications of  
soft tissue surgery***

- ***Undertreatment***
  - The psoas is a prime example.
  - incorrect physical exam technique (underdiagnosis)
  - concerns about complications
    - post-surgical weakness (a residual from the days of complete release of the tendon from the trochanter)
    - N/V injury

***Contraindications and complications of soft tissue surgery***

- ***Overly aggressive surgery*** to isolated structures.
  - TAL
  - combined medial and lateral hamstring lengthening
  - complete transfer of all of the hamstrings to the femur (Eggers)
  - obturator neurectomy
  - iliopsoas release at the lesser trochanter
- These procedures are **not** indicated for the treatment of gait dysfunction.

***Contraindications and complications of soft tissue surgery***

- Single level surgery leading to joint imbalance and the need for numerous trips to the operating room

***Contraindications and complications of soft tissue surgery***

- Inappropriate lengthening of ***one joint antigravity muscles*** leading to weakness.
  - tendo-Achilles lengthening
  - release of the iliopsoas tendon at the lesser trochanter

***2 joint timing muscles (affected by CP)***

- Psoas
- Hamstrings
- Gastrocnemius
- Rectus femoris

# INDICATIONS AND EXPLICIT GUIDANCE FOR SOFT TISSUE SURGERY USING GAIT ANALYSIS

Background

## Outline

- Muscle structure and pathophysiology
- Treatment options
- Diagnostic tools

## Muscle Structure

## Muscle Structure

## Muscle contracture in CP

DEVELOPMENTAL MEDICINE & CHILD NEUROLOGY REVIEW

**Could muscle deformity in children with spastic cerebral palsy be related to an impairment of muscle growth and altered adaptation?**

MARTIN GOUGH | ADAM P SHORTLAND

One Small Step Gait Analysis Laboratory, Guy's Hospital, Guy's and St Thomas' NHS Foundation Trust, London, UK

- Causes are multifactorial
  - Innervation
  - Mechanical
  - Growth

## Muscle contracture in CP

Muscle Nerve 29: 615-627, 2004

**STRUCTURAL AND FUNCTIONAL CHANGES IN SPASTIC SKELETAL MUSCLE**

RICHARD L. LIEBER, PhD,<sup>1</sup> SUZANNE STEINMAN, MD,<sup>1</sup> ILONA A. BARASH, BS,<sup>1</sup> and HANK CHAMBERS, MD<sup>2</sup>

<sup>1</sup> Departments of Orthopaedic Surgery and Bioengineering, Biomedical Sciences Graduate Group, University of California and Veterans Administration Medical Centers, 3550 La Jolla Village Drive, San Diego, California, 92161, USA

<sup>2</sup> Department of Orthopaedics, Children's Hospital and Health Center, San Diego, California, USA

- In-vivo measurement shows fascicles/sarcomeres that are not short
- Muscles are smaller

## Muscle contracture in CP

- Reduced muscle size
  - Volume
  - PCSA
  - Thickness
  - Belly length

## Interventions

- Global tone management
- Focal tone management
  - Botox
- Casting / stretching
- Surgery

## Diagnostic tools

- Physical examination
- Musculoskeletal modeling
- Ultrasound
- Spectrometry

## Modeling Muscle Geometry

Ajay Seth et al. / Procedia IUTAM 2 (2011) 212–232

Fig. 5: Gastrocnemii (calf) muscle paths wrapping over a wrap-cylinder affixed to the tibia

## Muscle-tendon lengths

- Calculate MTL based on joint positions (kinematics)

## Muscle-tendon lengths

## Example

*Journal of Orthopaedic Research*  
 25(10):2211-2218, 2007  
 © 2007 Orthopaedic Research Society

### Lengths of Hamstrings and Psoas Muscles during Crouch Gait: Effects of Femoral Anteversion

\*Lisa M. Schutte, \*Scott W. Hayden, and \*James R. Gage

\*Gillette Children's Specialty Healthcare, St. Paul, and Department of Orthopaedic Surgery and †Mechanical Engineering,  
 University of Minnesota, Minneapolis, Minnesota, U.S.A.

— Muscle lengths calculated with generic model  
 ..... Muscle lengths calculated with model that represents anteversion  
 (Anteversion equal to -50 degrees on the left and -20 degrees on the right)

## OpenSim

- Simbios
  - NIH funded project
- 92 muscles
- Extensively validated
- Adaptable for any gait lab
- Lengthening rate (velocity)

## Control data

- 83 kids
- Multiple speeds
- Calculate MTL and MTV
- Not all 92 muscles
  - No back/abdominal muscles
  - No foot muscles

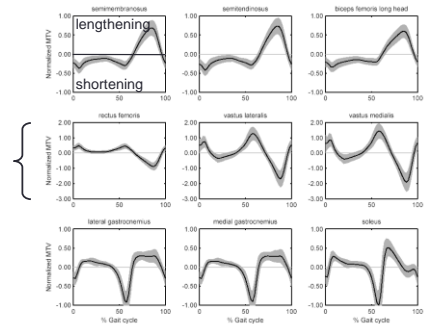

## Control data

## Control data - MTL

## Control data - MTV

## Why?

- Knee flexion does not predict RectFem length in SKG
- MTL and MTV was different from control

## Why?

- More likely to have a satisfactory outcome after hamstrings surgery if hamstrings were short/slow before surgery

## Effects of walking speed

- More subjects would have been considered to have adequate length/velocity if walking speed were taken into account

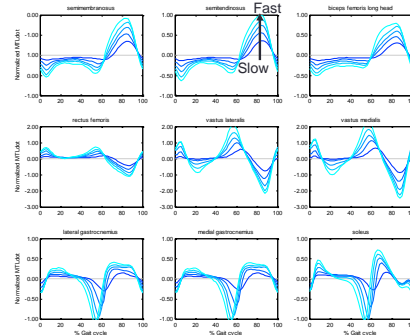

- Muscles function shorter and slower as spasticity increases

## Effects of walking speed

## Effects of walking speed

## Summary

- Pathophysiology of CP muscle is complex
- Several treatment options to lengthen muscles
  - Recurrence
  - Weakness
- Diagnostic tools
  - PE
  - Musculoskeletal modeling

## Indications and Explicit Guidance for Soft Tissue Surgery

### Physical Exam & Gait Data

## Hamstrings

**PCGR** Problem Centric Gait Report:

### Physical Exam:

Knee Flexion Contracture  
Popliteal angle – Unilateral/Bilateral  
Hamstring Spasticity  
Knee Extensor Lag (for quadriceps insufficiency)

### Gait Data:

Pelvis Kinematics  
Knee Kinematics  
Knee Kinetics  
Muscle Length & Velocity  
EMG hamstrings

## Hamstrings

### Physical Exam:

KNEE		
Extension	15	30
Popliteal angle		
unilateral	80	80
bilateral	70	70
HS shift	10	10
Extensor lag	15	20

### Gait Data:

## Hamstrings

### What Am I Looking For?

- Muscle-Tendon Lengths in terminal swing that are short, at-length, or long regardless of knee flexion contracture evidence.

KNEE		
Extension	15	30
Flexion		
prone	W/N	W/N
supine	W/N	W/N
Popliteal angle		
unilateral	60	65
bilateral	50	50
HS shift	10	15
Extensor lag	20	20
Patella alta	1	1

## Hamstrings

### What Am I Looking For?

- Muscle-Lengthening Velocities in mid swing that are slow or typical.

## Hamstrings

### Beware:

- Presence of at-length or long muscle-tendon lengths indicates absence of short hamstrings
- Presence of short muscle tendon lengths **does not** indicate absence of at-length or long hamstrings

## Psoas

### PCGR Problem Centric Gait Report:

#### Physical Exam:

Hip Flexion Contracture (Thomas test)  
Popliteal angle – Unilateral/Bilateral  
Hip Flexor Spasticity  
Gluteus Maximus Strength

#### Gait Data:

Pelvis Kinematics  
Hip Kinematics  
Hip Kinetics

#### Prediction of Outcome:

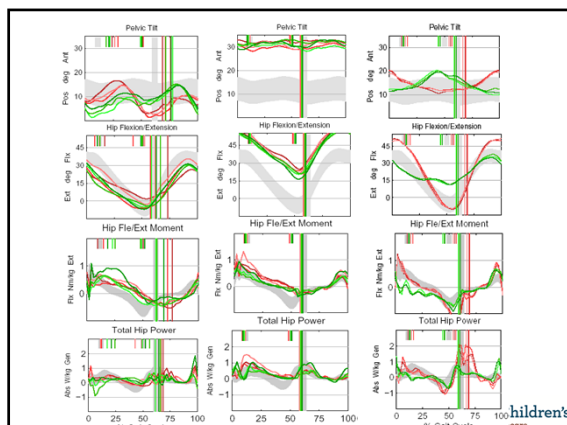

*under development*

## Psoas

### Physical Exam:

HIPS		
Flexion	WNL	WNL
Extension		
Thomas test	20	20
	SELECTIVITY, STRENGTH	
knee 90	2.2+/5	2.2+/5

## Gastrocnemius

### Physical Exam:

Plantarflexion Contracture vs. Tightness  
Plantarflexor Spasticity & Ankle Clonus  
Plantarflexor vs. Dorsiflexor Strength  
Foot Deformity  
Knee Contracture

#### Gait Data:

Ankle Kinematics  
Ankle Kinetics  
Gastrocnemius/Soleus EMG  
Knee Kinematics  
Knee Kinetics

## Gastrocnemius

### Physical Exam:

#### ANKLE SUBTALAR

Dorsiflexion		
knee 90	WNL	10
knee 0	-10	-10

	SELECTIVITY, STRENGTH	
Plantarflexion	7.8/5	1.1/5
Anterior tibialis	1.4+/5	0.3/5

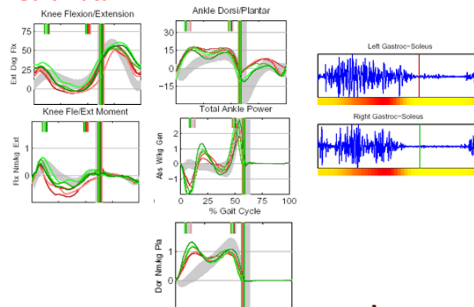

#### SPASTICITY (Ashworth Scale)

Plantarflex	3	3
Ankle clonus	2-4	2-3/5

## Gastrocnemius

### Gait Data:

Questions?

## Hamstrings

### Goals of Treatment

- allow extension of the knee in terminal swing without progressive posterior pelvic tilting
- in order to improve step length

## Medial Hamstring Lengthening

## Psoas

### Goals of Treatment

attain adequate length  
to allow normal hip extension  
without increasing anterior pelvic tilt

### Intramuscular Psoas lengthening (IMPL) at the pelvic brim

- oblique incision  
medial to the ASIS

## Intramuscular psoas lengthening at the pelvic brim

- pass right angle clamp around the psoas tendon
- transect the intramuscular tendon

## Psoas Lengthening at the Pelvic Brim

## Gastrocnemius

## Two important confounding factors

- **apparent equinus**
  - many of the above findings can also be seen
- **effects of mid-foot breakdown through the talonavicular joint**
  - can mask many of these findings
  - If the ankle cannot dorsiflex satisfactorily, then the excessive and premature forefoot loading leads to
    - increased stresses in the mid-foot
    - development of excessive range of motion (dorsiflexion and abduction) through the talonavicular joint
    - We must use a multisegment foot model!

***Because of these confounding factors,  
decision-making for gastrocnemius  
lengthening cannot be based  
solely on currently available  
quantitative gait data!***

The plantarflexors are very sensitive to lengthening!

## Surgical considerations

*Delp et al 1995*

- one centimeter lengthening of the soleus results in a 50% loss of its force generation capacity
- soleus -- particularly sensitive to lengthening
  - bi-pinnate muscle fiber orientation
  - short muscle fiber lengths
  - Diplegic/quadruplegic, lengthening rarely required
- gastroc -- much less sensitive to lengthening and is typically the only one that requires lengthening.

## Special considerations

- In hemiplegia, the soleus may also require lengthening. Fortunately, the risk of overcorrection is lower in hemiplegia than in di- or quadriplegia.
- Baker lengthening is more conservative than tendo-Achilles lengthening and can be considered (Borton et al 2001).
- In late presenting cases, tendo-Achilles lengthening (TAL) may be the only option to achieve the necessary amount of lengthening (rare if a child has been cared for in a coordinated, multidisciplinary center).

## Strayer gastrocnemius recession

- Midcalf incision @ muscle/tendon junction of gastroc
- Develop interval between gastroc and soleus (*beware sural nerve*)
- Divide gastroc fascia
- Extend knee/dorsiflex ankle to 0°
- Repair gastroc to soleus fascia
- Baker sometimes in hemiplegia

***Never Tendo-Achilles lengthening in ambulators!!***

## Baumann

- Medial incision @ muscle belly of gastrocnemius
- Develop interval between gastroc and soleus (*beware saphenous vein*)
- Divide deep gastroc fascia
- Extend knee & dorsiflex ankle to 0°
- No repair of gastroc fascia

## Goals of Treatment

- Satisfactory length in terminal stance (when it must achieve maximum length)
- Eliminate its deforming effects on the midfoot
- Improve stance phase stability by allowing a plantigrade foot position with the knee in full extension

## Strayer Gastrocnemius Recession

### Goals of soft tissue lengthening

- **Psoas**
  - attain adequate length to allow normal hip extension without increasing anterior pelvic tilt
- **Hamstrings**
  - allow extension of the knee in terminal swing without posterior pelvic tilting in order to improve step length
- **Gastrocnemius**
  - Satisfactory length in terminal stance (when it must achieve maximum length)
  - Eliminate its deforming effects on the midfoot
  - Improve stance phase stability by allowing a plantigrade foot position with the knee in full extension

### Still struggle with intraoperative decision-making

- Intraoperative assessment
  - Feels “really tight” or “not so tight”
- Goal attainment
  - “Ahh ... that’s much better. That feels looser!”

## Surgical Outcomes

Hamstrings | Psoas | Gastrocnemius

Michael H. Schwartz, Ph.D.

Director | Bioengineering Research  
Gillette Children's Specialty Healthcare  
Associate Professor | Orthopaedic Surgery  
University of Minnesota

## So many studies...so little time

- Psoas, Cerebral Palsy, Surgery = 41 articles
- Hamstrings, Cerebral Palsy, Surgery = 102 articles
- Gastrocnemius, Cerebral Palsy, Surgery = 348 articles

## Focus on Themes

## Hamstrings

Surgical Indications  
Crouch Gait  
Pelvic Tilt  
Muscle Length and Velocity

## Baumann (1980)

- Retrospective analysis
- 34 out of 66 patients

Baumann JU, Ruetsch H, Schürmann K. Distal Hamstring Lengthening in Cerebral Palsy. *International Orthopaedics (ICOT)*, 3:305-9, 1980

## Indications

- Not stated, but...
- "Surgical correction of the spastic crouch gait should lead to good knee extension during the stance phase of walking..."*

308 J. H. Baumann et al. / Distal Hamstring Lengthening in Cerebral Palsy

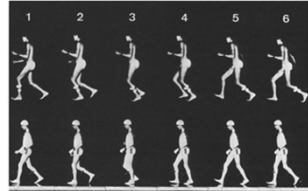

Fig. 6. Upper line: Boy age 13 with spastic diplegia and hamstring contractures. Lower line: Gait of the same patient 8 years after distal hamstring lengthening.

## Outcomes

- Knee extension improved throughout gait cycle

## DeLuca (1998)

- Retrospective analysis
- 73 patients, spastic diplegia
- Four groups
  - medial hamstrings
  - medial and lateral hamstrings
  - medial hamstrings + psoas over the brim of the pelvis (OTB)
  - medial and lateral hamstrings - psoas OTB

DeLuca PA, Ounpuu S, Davis RB, Walsh JHP. Effect of hamstring and psoas lengthening on pelvic tilt in patients with spastic diplegic cerebral palsy. *J Pediatr Orthop*. 18:712-18, 1998

## Indications

- Not stated, but...
- "The specific clinical measurements reviewed included popliteal angle as an indication of hamstring contracture,..."*
- All groups had Knee Flexion @ Initial Contact > 30°

## Outcomes

- Peak stance phase knee extension improved (11° – 18°)
- Pelvic tilt changes were heterogeneous
- "...fundamental determinants of pelvic position during gait postoperatively are the extent of hamstring surgery...and the preoperative position of the pelvis."*

Postsurgical Pelvic Position		
	PT < 16°	PT > 16°
Medial Only	n/c	n/c
Medial and Lateral	Worse	n/c
Medial and Psoas	n/c	n/c
Med + Lat + Psoas	Better	n/c

## Arnold (2006)

- Retrospective analysis – 152 patients from two centers
  - Gillette Children's Specialty Healthcare
  - Connecticut Children's Medical Center
- Patients
  - spastic cerebral palsy
  - able to ambulate without orthoses or other assistance
  - 6 years of age or older
  - at least 20° of knee flexion at initial contact or terminal swing

Arnold AS, Liu MQ, Schwartz MH, Ounpuu S, Delp SL. The role of estimating muscle-tendon lengths and velocities of the hamstrings in the evaluation and treatment of crouch gait. *Gait Posture*. 23:273-81, 2006

## Indications

- Goal of study to Investigate muscle Length/Velocity as indication

## Outcomes

- Lengthen short/slow hamstrings → improve knee ext.
- Lengthen of adequate hamstrings → worsen pelvic tilt

## Take Home Message

### Patients walking in crouch

## Psoas

Hip Strength  
Assistive  
Devices  
Age  
Surgical  
Indications

## Sutherland, DH et al. 1997

- Retrospective repeated-measures design
- 17 patients, 29 hips
- Recession at pelvic brim
- Adductor tenotomy, Hamstrings lengthening, and Rectus transfer on most hips

FIG. 1. A-F. Line drawings of operative technique for psoas recession at the pelvic brim.

Sutherland D, Zillerbergh J, Kaufman K, Wyatt M, Chambers R. Psoas Release at the Pelvic Brim in Ambulatory Patients with Cerebral Palsy: Operative Technique and Functional Outcome. *J Pediatr Orthop*, 17:563-70, 1997

## Surgical Indications

- Not stated, but...
- "representative case" given
- History
  - Term delivery
  - Mild delay in milestones
  - Persistent bilateral ankle equinus.
  - Bilateral Achilles tendon lengthenings at age 2 years
  - Repeat Achilles tendon lengthening at age 6 years
- Physical examination
  - Hamstrings contracture (popliteal angles 140°R and 110°L)
  - Passive hip extension was limited by 20° B
  - Deep tendon reflexes exaggerated in the lower extremities
- Gait study
  - Exaggerated stance phase anterior pelvic tilt and hip flexion, knee flexion
  - Prolonged rectus femoris, hamstring and adductor activity, Iliacus fired continuously

## Results

- Pelvic Kinematics
  - Pelvic tilt decreased (26° → 23°), but not significant (p = 0.06)
  - Improved significantly among independent ambulators
  - Significant effect of age

## Novacheck TF, et al. 2002

- Retrospective repeated-measures design
- 93 limbs from 56 patients
- Intramuscular psoas lengthening (IMPL) over pelvic brim
  - +/- Hamstrings lengthening
  - +/- Femoral Derotational Osteotomy
  - No prior Hams./FDO/Rhizotomy

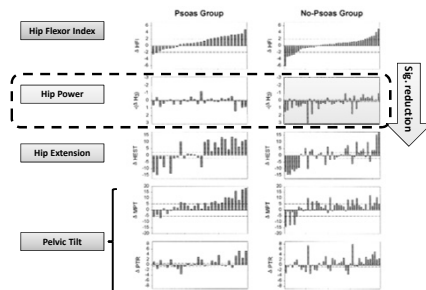

Novacheck TF, Trost JP, and Schwartz MH. Intramuscular Psoas Lengthening Improves Dynamic Hip Function in Children With Cerebral Palsy. *J Pediatr Orthop*, 22:158-64, 2002

## Surgical Indications

•Not stated

## Results

- Hip Strength
  - 10% loss of hip flexor strength ( $p < 0.05$ ) in Psoas group
- Hip Power

## Morais, M et al. 2006

- Retrospective repeated-measures study
- 52 limbs, 26 individuals

Morais MC, Godoy W, Santos C. Effects of Intramuscular Psoas Lengthening on Pelvic and Hip Motion in Patients With Spastic Diparetic Cerebral Palsy. *J Pediatr Orthop*, 26:260-4, 2006

## Indications

- One or more of following from gait data:
  - increase of anterior pelvic tilt
  - increase of pelvic tilt range of motion
  - Lack of hip extension at terminal stance.
- Hamstrings lengthening, used to avoid increased ant. pelvic tilt
- Thomas test NOT part of indications

## Results

- Anterior pelvic tilt significantly reduced for independent ambulators, but increased for those using walking aids

TABLE 2. Mean Values and SDs of 26 Patients Before and After Surgical Intervention

	Preoperative (degrees)		Postoperative (degrees)		Student <i>t</i>
	Mean	SD	Mean	SD	
Anterior pelvic tilt	18	5.1	17.1	5.8	0.384
Pelvic range of motion	11.2	3.3	9.1	2.6	0.0001
Hip extension	2.5	10.3	2.8	8.9	0.799

Truong WH, Rozumalski A, Novacheck TF, Beatty C, Schwartz MH. Evaluation of Conventional Selection Criteria for Psoas Lengthening for Individuals With Cerebral Palsy: A Retrospective, Case-Controlled Study. *J Pediatr Orthop*, 31:534-540, 2011

- **Controls:** 2/3 and -psoas lengthening as part of SEMLS

- Kinematics improved (Case v. Control) for GMFCS III and IV
- Reduction in Hip Strength (Case v. Control) for GMFCS III and IV
- No difference in Hip Power (Case v. Control)

Length	All GMFS Cases						GMFS Cases I and II						GMFS Cases III and IV

- Machine learning algorithm to find optimal indications

Schwartz MH, Truong WH, Rozumalski A, Novacheck TF. Predicting the outcome of intramuscular psoas lengthening in children with cerebral palsy using preoperative gait data and the random forest algorithm. *Gait Posture*, 37:473-9, 2012

- Variables related to:  
*Age, Speed, Pelvis/Hip Motion,  
 Swing Phase Knee Flexion*

- Potential benefit → 14% more good outcomes

# Gastrocnemius

Indications  
Recurrence  
Quality of studies

## Perry 1974

- Retrospective analysis
- 17 patients

Perry J, Hoffer M, Giovan P, Antonelli D, Greenberg R. Gait Analysis of the Triceps Surae in Cerebral Palsy. *J Bone Joint Surg Am*, 56-A:511-20, 1974

## Indications

- "clinical stretch test" (no values/ranges given)
- Failure to respond / significant recurrence after casting
- Persistent equinus ...despite bracing
- Additional Study Design Elements
  - cerebral palsy
  - four to eighteen years old

## Outcomes

- Improved dorsiflexion range by physical exam
- Improved timing/duration of muscle activation
- Several warnings of possible recurrence

## Shore (2010)

- Systematic Review  
*equinus deformity, cerebral palsy, orthopaedic surgery*
- 35 Articles, 19 used instrumented gait analysis (avg. follow-up 2.8 years)
- Most studies were level IV quality (case series)

Shore BJ, White N, Graham KH. Surgical correction of equinus deformity in children with cerebral palsy: a systematic review. *J Child Orthop*, 4:277-90, 2010

## Surgical Indications

- Not summarized

## Outcomes

- **Recurrent equinus: 0% - 43% (up to 62% in subgroups)**
- **Calcaneus: 0% - 36% (up to 80% in subgroups)**
- [Evidence is poor, sparse, heterogeneous, short-term, etc....]
- **"...greater incidence of recurrent equinus in children with hemiplegia regardless of procedure, and greater incidence of calcaneal gait and deformity in children with diplegia, particularly following procedures on the Achilles tendon."**

## Svehlik (2012)

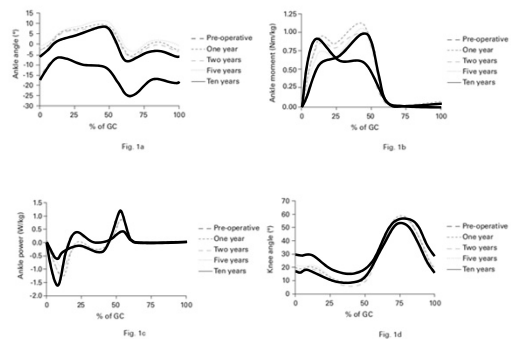

- **Retrospective analysis, long-term follow-up**
- **Instrumented gait analysis**
- **18 patients, 21 limbs**

Svehlik M, Kraus T, Steinwender G, Zwick EB, Saraph V, Linhart WE. The Baumann procedure to correct equinus gait in children with diplegic cerebral palsy: Long-term results. *J Bone Joint Surg Br*. 94-B:1343-7, 2012

## Surgical Indications

- **Not stated, but...**
  - **Inclusion Criteria for Study:**
    - Spastic diplegic CP
    - Equinus gait
    - Gross Motor Functional Classification System level I to III;
    - Ability to walk barefoot without walking aids at least for short distances
  - **Additional Study Criteria:**
    - full sets of kinematic and kinetic gait data collected pre-operatively and at one, two to three, five, and ten years post-operatively.
    - No further surgical treatment of equinus during the followup period;
    - No prior treatment with selective dorsal rhizotomy or intra-thecal baclofen.

## Outcomes

Graphs showing the changes in mean ankle and knee kinematics and kinetics over ten years following the Baumann procedure for a) ankle angle, b) ankle moment, c) ankle power, d) knee angle (GC, gait cycle).

## Outcomes

- **Recurrence @ 10 Years**
- **"comparable to the short-term results of ... (Strayer technique) in the study of Gough, Schneider and Shortland and those of lengthening of the tendo Achillis [Borton, et al., 2001]"**
- Gough ??%
- Borton 38%

## Conclusions

- **Extensive history of outcome studies for soft-tissue surgery**
  - Mixed outcomes
  - Contradictory reports
  - Controversy continues
- **Surgical indications**
  - **Rarely stated**
  - when stated, adherence rates not given
  - Impact of indications on outcomes not assessed
- **Future needs**
  - Better study designs
  - Prospective studies
  - More long-term outcome studies
  - Indications: state, evaluate, measure adherence
  - Role of gait data

## Indications and Explicit Guidance for Soft Tissue Surgery Using Gait Analysis:

### Case Study

Tom F Novacheck, MD; Adam Rozumalski, MS;  
Jean Stout, PT, MS; Mike Schwartz, PhD

Gillette Children's Specialty Healthcare  
St. Paul, MN, University of Minnesota

## Adverse Outcomes

- Be Judicious:

**Muscle Lengthening = Muscle Weakening**

- Types of Lengthening & Extent of Lengthening make a difference

**Tenotomy; Percutaneous Tenotomy;  
Intramuscular Lengthening; Fractional  
Lengthening**

- Consider alternative ways to maintain length & strength

## Meet AF-2011

## AF-2007

### 2005 Surgeries

- Bilateral percutaneous adductor tenotomies
- Bilateral percutaneous semitendinosis & gracilis tenotomies
- Bilateral semimembranosus fractional lengthening

## AF-2008

### 2008 Surgeries

- Left semitendinosus intramuscular tenotomy
- Left semimembranosus fractional lengthening
- Bilateral gastrocnemius aponeurotic lengthening

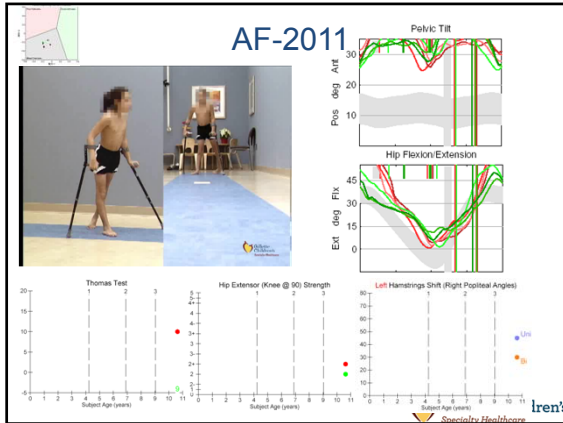

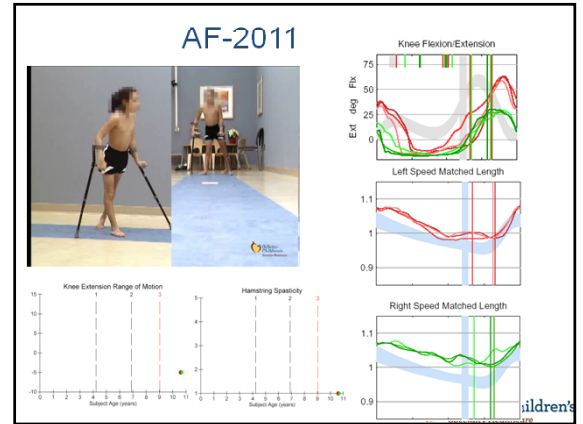

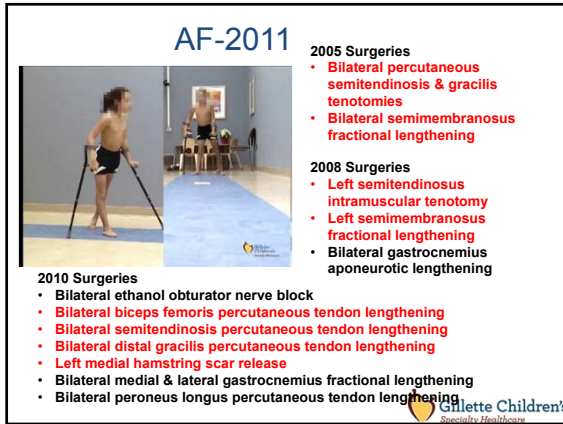

## AF-2010

### 2010 Surgeries

- Bilateral ethanol obturator nerve block
- Bilateral biceps femoris percutaneous tendon lengthening
- Bilateral semitendinosus percutaneous tendon lengthening
- Bilateral distal gracilis percutaneous tendon lengthening
- Left medial hamstring scar release
- Bilateral medial & lateral gastrocnemius fractional lengthening
- Bilateral peroneus longus percutaneous tendon lengthening

## Discussion
