

**of AUB**

DR. DEBRA GIERUT MD  
DEPARTMENT OF OBSTETRICS AND GYNECOLOGY  
Kaiser Permanente, Orange County

---

---

---

---

---

---

---

---

## DISCLOSURES

- ▶ I have no financial disclosures
- ▶ Lisa Samerdyke, the Director of National Accounts for Hologic provided the trimmed video I will use in this presentation, and she is also my friend.
- ▶ I am the Orange County Section Chair for ACOG and serve as a delegate to the California Medical Association, advocating for accessible, affordable, quality care for everyone in California
- ▶ I have 3 daughters and I am passionate about women's health and teaching quality and complete care to those who may serve them in the future

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**Where are we going today.....???**

- ▶ Definitions and Terminology
- ▶ Etiologies of AUB
- ▶ Evaluation
- ▶ Treatment options
- ▶ New stuff...
- ▶ Vignettes

---

---

---

---

---

---

---

---

**The Victorian period:  
when menstruation  
was a dangerous  
disease that could lead  
to madness**

History: Maternal Health, Reproductive Treatment & Therapy  
Medical History of Gynecology, University of Illinois at Chicago

---

---

---

---

---

---

---

---

**Definitions**

- ▶ Bleeding from the uterus that is abnormal in regularity, volume, frequency, or duration in the absence of pregnancy
- ▶ Classify as **acute** or **chronic** (>occurring for  $\geq$  previous 6 months)
- ▶ Acute may be spontaneous or in the context of chronic bleeding.
- ▶ It is worth knowing, is the patient pre or post menopausal
- ▶ 9-20% of reproductive age women have significant AUB that interferes with quality of life
- ▶ Accounts for about 1/3 of ambulatory visits to gynecologists
- ▶ Significantly impacts a women's quality of life, productivity, expense of hygiene products, and utilization of health care resources

---

---

---

---

---

---

---

---

## FIRST THINGS FIRST

- ▶ Pregnant or not?
- ▶ Menopausal or not?
- ▶ Determine acuity
- ▶ Rule out "bad" things-

### RULE #1

- ▶ Make a plan

---

---

---

---

---

---

---

---

## Hemodynamically Unstable or Hypovolemic

- ▶ Take your own pulse
- ▶ Ask for help
- ▶ 1-2 large bore IV lines
- ▶ Initiate procedures for transfusion of blood and clotting factors

---

---

---

---

---

---

---

---

## Anatomy, Anatomy, Anatomy

---

---

---

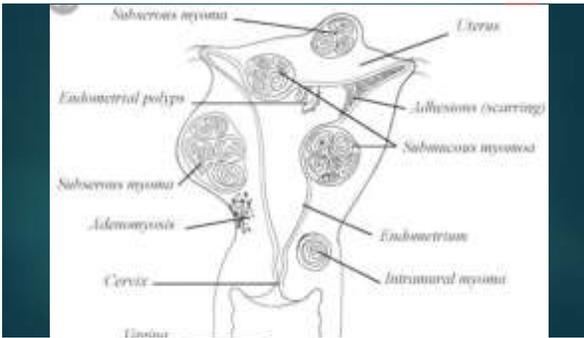

---

---

---

---

---

---

---

---

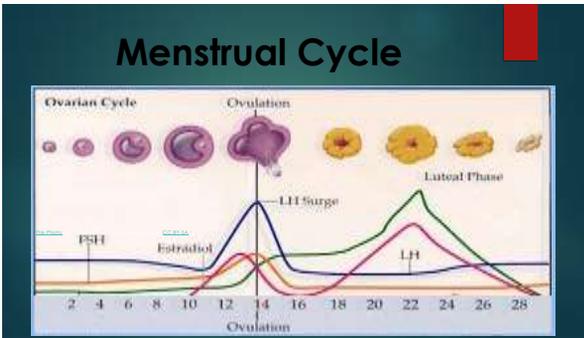

---

---

---

---

---

---

---

---

---

---

---

---

---

### Consider The Etiology

2011 IFGO and ACOG adopted new classification system

## PALM-COEIN

Abnormalities of **UTERINE STRUCTURE** versus **NOT** related to UTERINE STRUCTURE

Ovulatory or Anovulatory

---

---

---

---

---

---

---

---

## PALM

- ▶ Polyp
- ▶ Adenomyosis
- ▶ Leiomyoma
- ▶ Malignancy

---

---

---

---

---

---

---

---

## COEIN

- ▶ COAGULAPATHY
- ▶ OVULATORY
- ▶ ENDOMETRIAL
- ▶ IATROGENIC
- ▶ NOT YET CLASSIFIED

Considerations

- ▶ 13% of women with AUB may have a variant of von Willebrand disease
- ▶ 20% may have underlying coagulation disorder
- ▶ Underlying medical conditions or medications

Rare causes: Uterine AV malformations (congenital or acquired), cesarean scar defects.

---

---

---

---

---

---

---

---

## Anovulation AUB

Generally at irregular intervals and excessive in in duration or volume

- ▶ PCOS
- ▶ Diabetes Mellitus
- ▶ Thyroid dysfunction
- ▶ Hyperprolactinemia
- ▶ Antipsychotics
- ▶ Antiepileptics
- ▶ Pregnancy
- ▶ Eating disorder

---

---

---

---

---

---

---

---

## Ovulatory AUB

Generally, regular timing but excessive in amount or duration

50% of these women have no discernable cause-

?Adenomyosis?

- ▶ Thyroid dysfunction
- ▶ Coagulation defects
- ▶ Polyps
- ▶ Submucosal fibroids

---

---

---

---

---

---

---

---

## Endometrial polyps

- ▶ Polyps are overgrowths of endometrial glands and stroma over a vascular core.
- ▶ The natural history of polyps is unknown and not likely related to age, menopausal status or size or growth rate of the polyp
- ▶ < 2% were hyperplasia or malignancy in premenopausal patients
- ▶ < 6% were hyperplasia or cancer in postmenopausal women

---

---

---

---

---

---

---

---

## Evaluation

- ▶ **History, History, History, History** (including menarche, family history, timing of when blood is seen)

\*Is patient pregnant, still in reproductive phase, peri or post menopausal?

\*Pattern, Severity, and Source (PSS)

- ▶ Pregnancy test, CBC, TSH

Possible need for fibrinogen, ptt, VW-ristocetin, VWB antigen, Factor VIII, LFTs

- ▶ Physical examination
- ▶ Endometrial Sampling
- ▶ Ultrasound

---

---

---

---

---

---

---

---

### WHAT TO DO FIRST???

Depends on what you suspect, what you need to know, and what you plan on doing about it.....

---

---

---

---

---

---

---

---

### Remember RULE #1: Rule Out Bad Things

- ▶ Labs
- ▶ Endometrial Sampling: general rule: any AUB at age  $\geq 45$  or age  $\geq 40$  with obesity (BMI  $> 30$ ).
- ▶ Ultrasound?
- ▶ Sonohystogram?
- ▶ Hysteroscopy?

---

---

---

---

---

---

---

---

### Endometrial Cancer

- ▶ Worldwide incidence is about 9/100,000. lifetime risk is 1%
- ▶ **Recurrent anovulation** can cause endometrial cancer
- ▶ 10-20% of endometrial cancers are in premenopausal women. Overall risk for endometrial cancer in the premenopausal women is 1.3%
- ▶ Risk factors: obesity, nulliparity, AUB, advanced age ( $> 50y/a$ ), DM unopposed estrogen therapy tamoxifen use, family history of uterine, ovarian or colon cancer
- ▶ Precursor to endometrial cancer is endometrial hyperplasia WITH atypia. If untreated 30% progress to cancer. 43% have underlying undiagnosed adenocarcinoma
- ▶ Endometrial hyperplasia without atypia- considered benign.  $< 5\%$  progress to cancer

---

---

---

---

---

---

---

---

# LABS

- ▶ HCG\*
- ▶ CBC\*
- ▶ TSH
- ▶ Prolactin
- ▶ If coagulation defect suspected- VWF, PT, PTT
- ▶ FSH, E2- in special circumstances
- ▶ Pap/HPV
- ▶ GC, Chlamydia, if indicated for R/O cervicitis
- ▶ STD screening?

\* Everyone has these tests

---

---

---

---

---

---

---

---

# Endometrial biopsy

**"TISSUE IS THE ISSUE"**

**PROS:**

- ▶ Easy to do
- ▶ Low risk
- ▶ Can be done at the time of initial evaluation
- ▶ Rules out malignancy, primarily
- ▶ 98% specific, 91% sensitive for carcinoma detection
- ▶ All agree that IMB should lead to EMB. Age and risk factors may influence decision for EMB. Heavy flow not as well associated with cancer

**CONS:**

- ▶ Pain
- ▶ May not be able to get adequate sample
- ▶ Does not answer questions about anatomy

---

---

---

---

---

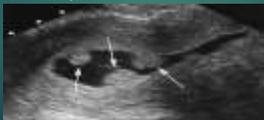

---

---

---

# ULTRASOUND

- ▶ Tells us about external and internal anatomy of the uterus and the adnexa
- ▶ May allow for better planning for surgical and non surgical options
- ▶ In a menopausal patient may obviate need for painful biopsy if the EMS is less than 4 mm
- ▶ **Sonohystogram** may help diagnose intracavitary lesions. Improves sensitivity and specificity for intracavitary abnormalities
- ▶ Not necessary, if etiology of AUB found on exam, i.e. cervical polyp.

---

---

---

---

---

---

---

---

# HYSTEROSCOPY

**PROS:**

- ▶ Intimately evaluate the internal anatomy of the uterus
- ▶ Sampling of the endometrium can be done simultaneously
- ▶ Remove potentially offending pathology
- ▶ Potentially facilitates see and treat in one visit
- ▶ Anesthesia provides more comfortable evaluation and treatment

**CONS:**

- ▶ Increased risk: infection, injury to viscera, complications of fluid overload hemorrhage risk 2.4%, perforation risks 1.5%
- ▶ Increased expense
- ▶ Increased risk if done in OR with general anesthesia

---

---

---

---

---

---

---

---

# Treatments

*Goal is to CONTROL acute episode, and then to reduce menstrual blood loss in SUBSEQUENT cycles*

- ▶ First line is almost always medical management with hormone therapies
- ▶ Only US FDA approved treatment specifically for acute AUB is IV conjugated equine estrogen
- ▶ Surgical management, only if needed based on underlying medical conditions, unresponsiveness to medical interventions, or hemodynamic instability

---

---

---

---

---

---

---

---

# Medical Management

**ACUTE**

- ▶ IV conjugated equine estrogen- 25 mg q 4-6 hours x 24 hours
- ▶ Combination OC- TID x 7 days
- ▶ Oral Progestins (medroxyprogesterone acetate)- 20 mg TID x 7 days if ovulatory menorrhagia, may need 12 days a month of therapy
- ▶ NSAIDs- Ibuprofen, Naprosyn, Mefenamic Acid
- ▶ Tranexamic acid (Lysteda)-1.3 g orally TID x 5 days (better for chronic AUB)
- ▶ If VWD- desmopressin ( intranasal, IV or subQ)
- ▶ Possible need for blood transfusion and/or factor replacement

**OC and progestins work to stop 78-88% in 3 days**  
**TXA- 30-55% reduction in bleeding in chronic AUB**

---

---

---

---

---

---

---

---

## Levonorgestrel IUD

- ▶ Superior to all other alternative in cost and Quality of Life scores (compared to ablation, hysterectomy)
- ▶ In the obese patient, 73% effective at 6 months, 93% at 12 months with improved productivity, fatigue, less depressing, improved hygiene
- ▶ Can be placed at the time of hysteroscopy
- ▶ FDA approved for use for 5 years

---

---

---

---

---

---

---

---

## Longer Term Medical Interventions...

- CHRONIC
- ▶ **Levonorgestrel IUD**- about \$9/month
  - ▶ **OCs**- about \$9-90/month
  - ▶ **Progestins** (oral or intramuscular) \$13-60/month
  - ▶ **NSAIDS**- \$4/month
  - ▶ **Tranexamic acid**- \$170/month

---

---

---

---

---

---

---

---

## Surgical Management

- ▶ Dilation and Curettage
- ▶ Endometrial Ablation- 5 years our 30% need 2<sup>nd</sup> operation
- ▶ Uterine Artery Embolization (UAE)
- ▶ Hysteroscopy with polypectomy and/or myomectomy
- ▶ Hysterectomy

**Choice depends on anatomic abnormality, desires for future fertility, patient's clinical condition and stability, and bleeding severity**  
 20% of ALB not definitively treated will reoccur

---

---

---

---

---

---

---

---

### Dilation and Curettage

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Endometrial Ablation

---

---

---

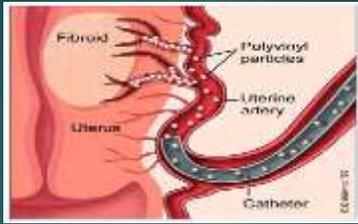

---

---

---

---

---

Embolus material: Gelatin sponge, silicone spheres, gelatin microspheres, metal coils, polyvinyl alcohol particles  
 Possible embolic spread, decreased ovarian reserve, shedding of necrotic myoma in uterine cavity  
 Fertility concerns

---

---

---

---

---

---

---

---

---

---

### Uterine Artery Embolization

---

---

---

---

---

---

---

---

---

---

### UTERINE POLYPS (endometrial Polyps)

---

---

---

---

---

---

---

---

---

---

### Hysteroscopy with Polyp Removal

---

---

---

---

---

---

---

---

### Our KP Hysteroscopy experience...

- ▶ Office hysteroscopy since 2005
- ▶ Average cost is roughly <\$100, - Saves OR time, OR staff and anesthesia. OR is about \$2500 ( saves at least 1.5 million a year)
- ▶ Our experience: about 600-700 per year ( combination of Essure, Myosure, ablations, diagnostics)
- ▶ In addition to improved safety, consistency ( provider, staff equipment), monetary savings of about ....

---

---

---

---

---

---

---

---

### Hysterectomy

---

---

---

---

---

---

---

---

### Emerging issues in AUB...

- ▶ AUB in the context of obesity
- ▶ BMI  $\geq 30$  – 4x more likely to develop hyperplasia or cancer
- ▶ Use of **ULIPRISTAL ACETATE** for AUB and/or fibroids (2018 study) at dose of 5-10 mg daily x 12 weeks

---

---

---

---

---

---

---

---

## SUMMARY

- ▶ A good **history and physical** are priceless
- ▶ Rule out "Bad Things"
- ▶ Think "with the end in mind"- what is the **goal** of evaluation and therapy. Think efficiency
- ▶ Remind patients that **TREATMENT PLANS** can change, as symptoms and concerns change.

---

---

---

---

---

---

---

---

### Patient #1

Suzy is a 26 y/O G0 with AUB (menometrorrhagia) for the past 2 years. She is now missing work due to fear of accidents with **heavy, unexpected** bleeding episodes. She is a **flight attendant**. She is **sexually active** with her Yogi boyfriend and is not using birth control as he does not want her to "ingest chemicals". Susy also remembers that when she used OCs as a teen, her **migraines with aura** got worse. Her **BMI is 35**, now that she had **gastric bypass**. Suzy is interested in **contraception** and decreasing her blood flow each month so she does not miss work. She does **want children** in the future but not for at least 2 years.

- ▶ What lab tests are warranted?
- ▶ Are there medical or social issues in her history that warrant ultrasound? Endometrial sampling?
- ▶ What options would best serve her for her needs?
- ▶ What do you think etiology is? : "PSS"

---

---

---

---

---

---

---

---

**Labs:** HCG, CBC, TSH, Prolactin, STD screening  
Pap/HPV  
US for anatomy evaluation  
+/-EMB versus hysteroscopy with LVN IUD

---

---

---

---

---

---

---

---

### Patient #2

Helen is a **47 y/o** G3P3 executive with new onset of AUB (menorrhagia). She is newly divorced and deeply committed to **online dating**. She has no method of contraception on board (her ex had a vasectomy). She also reports some **night sweats, especially around the time of her menses**. Menses are spacing out but lasting longer and heavier (10+days). She remembers being told at some point that she had **fibroids**. Exam is remarkable for normal BMI and mild globular 9 week size uterus with no other palpable masses.

- ▶ Does Helen need endometrial sampling? Ultrasound? Labs?
- ▶ Is there a role for hysteroscopy?
- ▶ What contraception options may also provide a treatment strategy for her menorrhagia?
- ▶ Is an Endometrial Ablation a good option??

---

---

---

---

---

---

---

---

Labs: CBC,TSH, STD screening, Pap/HPV  
Ultrasound

Hysteroscopy- **YES!!!**

- ▶ Hysteroscopy: See, sample and treat with anesthesia in place
- ▶ May need ERT for perimenopausal symptoms. Progestin of L-IUD could serve as endometrial protection and contraception
- ▶ Ablation is **not** a good option if fibroids. It is also **not** a form of contraception

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---
