Think Outside the Mouth – Treatment Planning for Nonsurgical Periodontal Treatment

Thursday, June 9, 2016
9:30 a.m.-12:30 p.m.
Think Outside the Mouth
*Treatment Planning for Non-surgical Periodontal Treatment*
Karen Davis, RDH, BSDH

The long-term sustainable strategy for global oral health should focus on health promotion and disease prevention through effective multidisciplinary teamwork. *Oral Diseases 2015*

- Widespread systemic health effects may be associated with, exacerbated by, or caused by periodontal disease.

  An Association: patients with periodontal disease could be at an increased risk for systemic disease, but evidence does not support periodontal disease being causative

  A Causal Relationship: periodontal disease initiates or causes the systemic disease

  A Bi-directional Relationship: periodontal disease contributes to or causes the systemic disease and the systemic disease contributes to or causes periodontal disease

- Oral environment serves as a reservoir for pathogenic bacteria and in susceptible hosts, the balance shifts from homeostasis within the biofilm to an imbalance that fosters inflammation and disease.

- Periodontitis can influence the host immune response and become a source for disseminating pathogens systemically, thereby increasing the burden of inflammation and circulating inflammatory markers.

- The host response to inflammation can be influenced by behavioral, environmental, acquired, bacterial and genetic factors.

- Disruption, removal and control of disease-promoting biofilm can drive down inflammation.

- Restoration of homeostasis promotes health.
Periodontitis: from microbial immune subversion to systemic inflammation
By George Hajishengallis Nature Reviews Immunology 15, 30–44 (2015)

CARIOVASCULAR DISEASE AND PERIODONTAL DISEASE

Extensive review of the literature indicates that PD is associated with ASVD independent of known confounders. They do not report a causative relationship. 
Circulation 2012

The Oral Infections and Vascular Disease Epidemiology Study (INVEST) of 2013 found that improvements in periodontal status are associated with diminished progression of carotid atherosclerosis. 
Journal of the American Heart Association 2013

In coronary heart disease patients with periodontitis, BOP is strongly associated with systemic CRP levels; this association possibly reflects the potential significance of the local periodontal inflammatory burden for systemic inflammation. 
Journal of Clinical Periodontology 2014

Biochemical and physiological analyses involving in vitro experiments, animal models, and clinical studies provided evidence for the substantial impact of periodontal pathogens, their virulence factors, and bacterial endotoxins on all general pathogenic CVD mechanisms such as endothelial dysfunction, systemic inflammation, oxidative stress, foam cell formation, lipid accumulation, vascular remodeling, and atherothrombosis. Interventional studies showed moderate beneficial effects of PD treatment on reducing systemic inflammation and endothelial dysfunction. However, no interventional studies were performed to assess whether periodontal therapy can primarily prevent CVD. In summary, current data suggest for a strong contributory role of periodontal infection to CVD but cannot provide sufficient evidence for a role of PD as a cause for cardiovascular pathology. 
Experimental and Molecular Pathology 2016

DIABETES AND PERIODONTAL DISEASE

Susceptibility to periodontal disease is increased approximately 3-fold in people with diabetes. Periodontal infection may exacerbate insulin resistance. 
Diabetologia 2012

The result indicates that SRP is effective in improving metabolic control in Type 2 Diabetes Mellitus patients possibly through the reduction of TNF-α which in turn might improve the insulin resistance. 
Journal of Clinical and Diagnostic Research 2014

There is low quality evidence that the treatment of periodontal disease by SRP does improve glycemic control in people with diabetes, with a mean percentage reduction in HbA1c of 0.29% at 3-4 months; however, there is insufficient evidence to demonstrate that this is maintained after 4 months. In clinical practice, ongoing professional periodontal treatment will be required to maintain clinical
improvements beyond 6 months. Larger, well-conducted and clearly reported studies are needed in order to understand the potential of periodontal treatment to improve glycemic control among people with diabetes mellitus.

Cochrane Database Systematic Review 2015

**OBESITY/BMI AND PERIODONTAL DISEASE**

The fact that TNF-alpha and IL-6 are produced in the adipose tissues could support the shared link between obesity, type 2 diabetes and periodontitis

Internal Medicine 2010

A high waist circumference significantly associated with periodontal disease opposed to BMI.

Journal of Periodontology 2011

Increases in BMI were associated with worsening of periodontal status, in Japanese university students, whereas lack of inter-dental cleaning was associated with exacerbated gingival bleeding.

Journal of Clinical Periodontology 2014

**PERIODONTITIS AND NAFLD**

Periodontal treatment has been found to improve the liver functional parameters in NAFLD patients, signifying the fact that P gingivalis-positive periodontitis may be a risk factor for the progression of NAFLD.

Journal of Periodontology 2006

BMC Gastroenterology Journal 2012

**RESPIRATORY DISEASES**

Based upon 19 studies, a systematic review of the literature reveals the following: There is fair evidence of an association of pneumonia with oral health. There is poor evidence of a weak association between COPD and oral health. There is good evidence that improved oral hygiene and frequent professional oral health care reduces the progression or occurrence of respiratory diseases among high-risk elderly adults living in nursing homes and especially those in intensive care units.

Journal of Periodontology 2006

A cross-sectional study of a group of 100 cases of hospitalized patients with respiratory diseases compared to a group of 100 cases systemically healthy out-patient controls supports an association between respiratory disease and periodontal disease. Patients with respiratory disease had significantly greater poor periodontal health (OHI and PI), gingival inflammation (GI), deeper pockets, and CALs compared to controls.

Journal of Periodontology 2011
**RHEUMATOID ARTHRITIS AND PERIODONTAL DISEASE**

Small studies have shown significant decreases in disease activity scores, and decreases in gingival crevicular fluid inflammatory markers 1 to 6 months following periodontal therapy in rheumatoid arthritis patients.  
*Rheumatology International 2013*

A systematic review of the literature reveals that non-surgical periodontal treatment in individuals with periodontitis and RA can lead to improvements in markers of disease activity in RA. All studies had low subject numbers with the periods of intervention no longer than 6 months. Larger studies are required to explore the effect of non-surgical periodontal treatment on clinical indicators of RA.  
*Seminars in Arthritis and Rheumatism 2014*

**ADVERSE PREGNANCY OUTCOMES AND PERIODONTAL DISEASE**

Contradictory evidence exists revealing a reduction in adverse pregnancy outcomes following periodontal therapy in the second trimester. Periodontal therapy, if administered before pregnancy, may provide more beneficial results.  
*Journal of International Oral Health 2015*

Once the inflammatory cascade is activated during pregnancy interventions may be ineffective in reducing PTB. Treatment may be too late.  
*New England Journal of Medicine 2006*

Systematic Review indicates SRP reduced risk of PTB only for women at high risk of PTB.  
*Journal of Periodontology 2012*

**ERECTILE DYSFUNCTION AND PERIODONTAL DISEASE**

From the results of this study, it can be concluded that chronic periodontitis and ED are associated to each other. The possible mechanism, which may be involved, is that periodontal pathogens after entering blood stream may travel to distant sites where these stimulate release of pro inflammatory cytokines and acute phase proteins, which may lead to endothelial damage causing ED.  
*Indian Journal of Dental Research 2014*

**ALZHEIMER’S DISEASE AND PERIODONTAL DISEASE**

The most convincing evidence for a causal relationship between oral bacteria and AD is noted for spirochetes. P. gingivalis, C. pneumoniae, H. pylori, Herpes simplex type I virus, and Candida are among the prime candidate pathogens in AD brains. It is likely that oral infection can be a risk factor for AD but it is not the only one. Experiments in humans may require long exposure time to disclose key events and mechanisms of AD.  
*Journal of Oral Microbiology 2015*
**CHRONIC KIDNEY DISEASE AND PERIODONTAL DISEASE**

Patients with CKD have higher prevalence of periodontal disease while non-surgical periodontal therapy has been indicated to decrease the systemic inflammatory burden in patients with CKD specially those undergoing hemodialysis therapies.

Pakistan Journal of Medical Sciences 2013

**ORAL CANCER AND PERIODONTAL DISEASE**

Each millimeter of bone loss due to periodontal disease was associated with a greater than fourfold increased risk of head and neck cancer.

Cancer Epidemiology Biomarkers & Prevention 2009

**BREAST CANCER AND PERIODONTAL DISEASE**

Periodontal disease was associated with increased risk of postmenopausal breast cancer, particularly among former smokers who quit in the past 20 years.

Cancer Epidemiology Biomarkers & Prevention 2016

Evidence-based Clinical Practice Guideline on the Nonsurgical Treatment of Chronic Periodontitis by Means of Scaling and Root Planing With or Without Adjuncts

Committee of experts and review of the literature:

Evidence Favors: SPR as initial nonsurgical treatment for chronic periodontitis
Evidence Favors: systemic subantimicrobial-dose doxycycline (20 mg 2X daily 3-9 months)
Weak Evidence: systemic antibiotics
Weak Evidence: chlorhexidine chips
Weak Evidence: photodynamic therapy with a diode laser
Expert Opinion For: doxycycline hyclate gel & minocycline microspheres
Expert Opinion Against: non-PDT diode, NdYAG, and erbium lasers as SRP adjuncts

Clinical Protocols for Biofilm Management with Subgingival Air Polishing:

(Optional: Sodium bicarbonate air polish for stain removal on tooth surfaces)

1. Air polish with glycine for supra and subgingival biofilm removal prior to instrumentation
2. Remove supragingival and subgingival calculus and coronal stain with power instruments (Use ultrasonic on low setting to detect subgingival calculus)
3. Site-specific instrumentation with hand instruments (Laser optional)

~FULL MOUTH DEBRIDEMENT OR QUADRANT THERAPY?~

2015 Systematic Review & Meta-Analysis of Full Mouth Debridement (FMD) compared to Quadrant Scaling (QS) 13 Studies. 3 to12 month follow-up. Pocket depth reduction 0.25mm greater for FMD vs. QS in single-rooted teeth with 4 – 6 mm pockets. Clinical attachment level gain 0.33 greater for FMD vs. QS in single and multi-rooted teeth with moderate pockets. Both treatments were effective with no serious side-effects of treatment. Time savings with FMD. Authors favored FMD.

with Periodontist and General Dentist) www.perio.org

D4345 – Initial debridement to enable diagnosis

Extended Appointment Considerations for FMD
• Diagnosis and Initial Debridement, as indicated, prior to therapy
• Guarantee appointment with credit card or prepayment for extended time
• Report lengthened appointment times to insurance for consideration of full
  benefits

Periodontal maintenance is started after the completion of active therapy and
continues at varying intervals for the life of the dentition or implant replacements.
ADA CDT 2015-2016

Periodontal Maintenance
  Goal: Disease Remission
  Dismantle All Biofilm
  Modify Risk Factors
  Evaluate Disease Threshold
  Assessment for Referral/Co-Management

PM is not synonymous with a prophylaxis. Most patients with a previous history of
periodontitis should obtain PM at least four times per year, since that interval will
result in a decreased likelihood of progressive disease, compared to patients
receiving PM on a less frequent basis. Nevertheless, the PM schedule should be
individualized.

“As the professional is obligated to inform the patient that professional plaque control
is necessary on a 2 – 3 month basis…Providing periodontal treatment without
accompanying Periodontal Maintenance should be considered negligent care by the
practitioner….The patient retains the duty to perform adequate personal plaque
control and acquires the duty of complying with the prescribed interval for
professional plaque control. Failure of the patient to comply with these duties will
result in disease progression, which the professional will be powerless to prevent.”
Journal of the American Dental Association - What Year?
