Symmetric energy windows

Intrinsic uniformity, ^{99m}Tc , 35 million counts each image, no central subcomponent of image, acceptance testing.

Dynamic clinical study – Energy peak shift – Electrical grounding problem

Dynamic clinical study of kidney function using a ^{99m}Tc radiopharmaceutical. 10% energy window.

Asymmetric window

Schematic representation of asymmetric energy windows

Symmetric/Asymmetric energy windows - Poor PMT balance and crystal hydration

Four million counts were acquired in each of the four bilateral collimator viewed QC images. Images with asymmetric windows were acquired in order to check PM tube balance and whether there was any hydration of the crystal.

- TL: 20% symmetric energy window, approximately 30 000 counts.
- TR: 20% symmetric energy window, approximately 75 000 counts.
- BL: 10% asymmetric high energy window.
- BR: 10% asymmetric low energy window.

Asymmetric energy window – fault in energy correction map

Kidney calibration, ^{99m}Tc, 3 million counts each image.
 TI: 30% energy window asymmetric high (offset high)
 TR: 30% energy window asymmetric low (offset low)

Asymmetric energy window – clinical example with I-123 and Tc-99m

A: Kidneys
 B: Kidneys calibrated for ^{99m}Tc
 C: Kidneys calibrated for ¹²³I
 A: First series of kidney studies after intravenous injection of ¹²³I hippuran.
 B: Second series of kidney studies after a short 90 s postinjection study using ^{99m}Tc DTPA (not shown here) and intravenous administration of ^{99m}Tc.
 C: ¹²³I; flood source imaged in the ^{99m}Tc energy window.

Clinical example - TI-201 uniformity - Defective linearity correction

A: Clinical study
 TI: 20% energy window at 69-88 keV, 300,000 counts each image, anterior
 TI: Liver studies
 TR: Mid-abdomen — Liver region, asymmetry is seen in the upper part of the image.
 BL: Thorax, asymmetry is seen in the lower part of the image.
 BR: Head and neck.
 TI: ²⁰¹Ti calibration check was made following the clinical study and was compared with the daily watermarks check for ^{99m}Tc.
 B: ²⁰¹Ti, 30% energy window at 73 keV, 3 million counts.
 C: ^{99m}Tc, 30% energy window at 140 keV, 3 million counts.

Uniformity – Ga-67 – Separate and sum of energy windows

Intrinsic uniformity, ⁶⁷Ga, 15% energy window at 40, 50 and 60 keV, 1 million counts each image.

- 1) Uniformity for 40 keV energy window.
- 2) Uniformity for 50 keV energy window.
- 3) Uniformity for 60 keV energy window.
- 4) Uniformity for all three energy windows together.

Image without linearity or energy corrections

Four quadrants for patient, intrinsic uniformity, ^{99m}Tc, 4 million counts.

Side-by-side comparison with and without uniformity corrections

Intrinsic uniformity, LEHR collimator, ^{99m}Tc, 15% energy window, 4 million counts each image. Linearity and energy corrections have been applied.

- L: Uniformity obtained after application of a uniformity correction map.
- R: Uniformity obtained without the uniformity correction map.

Fault energy correction map – Clinical study

Patient study of ¹²⁵I: monoclonal antibody distribution in the lower abdomen immediately after a hardware energy calibration was performed. Anterior view, LEHR collimator, 30% energy window.

Loss of hermetic seal/optical coupling

The normal 4 million count daily OC flood from one detector of a dual head system.

- TL: Image acquired with the detector facing downward and with the antineutrino correction outward.
- TR: Image acquired with the antineutrino correction ring (external casing) rotated turned off but with the energy and linearity corrections operating.
- BL: Image showing the effect of rotating the detector so that it faced upward.

Cracked crystal – Puncture/impact

Images: 100% ¹²⁵I, 30% energy window, 7 million counts each image.

- A: Uniformity image.
- B: Resolution image obtained with a source for center.

Cracked crystal – Puncture/impact

These routine uniformity (L) and spatial resolution (R) images show large, cold zigzag cracks with hot edges. This was caused by impact on the crystal. The camera is unusable until the crystal is replaced.

Cracked crystal - Thermal

These routine uniformity image shows cracks cold areas with hot edges. These are due to a impact caused by a heated stand in the room. The images on the right show the upper right hand edge of the (TMI) cracked from poor fix processing.

Crystal hydration

A set of analog images were acquired as part of a QC programme. A ^{99m}Tc point source was used to acquire 1.25 million counts in each image.

- TL: Count rate ~30 000 counts/s, symmetric energy window.
- TR: Count rate ~73 000 counts/s, symmetric energy window.
- BL: Asymmetric energy window set high.
- BR: Asymmetric energy window set low.

Crystal Irregularities

Acceptance testing, intrinsic uniformity, 15% symmetric energy window, 10 million counts.

- 1. Suspected non-uniformity image.
- 2. Photograph of part of the crystal since when it had been removed for replacement. A string was drawn into the crystal to create the characteristic structure.

Uniformity – Defective PM Tube

Uniformity – Defective PM tube (newer digital camera)

^{99m}Tc, 15% energy window, 10 million counts, modern camera.

Defective PMT at FoV edge

^{99m}Tc, 15% symmetric energy window, 256 × 256 matrix, 10 million counts.

Clinical bone scan – defective PM tube

Bone scan of patient using ^{99m}Tc phosphate, 15% energy window

TL, TM and RL: Camera A — different single spot views of the skeleton: posterior, right anterior and right anterior oblique, respectively.
RM: Camera A — fixed field image taken after the spot views.
TR and BR: Camera B — posterior spot views of the same patient.

Maladjusted PM tube

Routine intrinsic uniformity, ^{99m}Tc, 15% energy window, 128 × 128 matrix. The image has been contrast enhanced.

Unacceptable extrinsic floods – Low energy collimator misalignment

Round FOV camera. The left image from the LEAP collimator shows a satisfactory response. The LEHR collimator (right) shows a distinct streak artefact due to hole misalignment with respect to the crystal face. This collimator requires replacement. These images were acquired at acceptance testing.

Unacceptable extrinsic floods – Low energy collimator angulation

- I: The LEAP collimator shows no abnormality in the image of the distant point source.
- E: The striped response in both x and y directions indicates severe collimator hole angulation problems at manufacture, i.e. the axes of the holes are not parallel to one another and perpendicular to the surface of the collimator. This collimator is unacceptable and requires replacement.

Unacceptable extrinsic flood – Collimator septa damage - Puncture

Round primary collimator check, LEHR collimator, ^{99m}Tc flood source, 3 without scatter.

- I: Analogous collimator image.
- E: High contrast digital image with a profile superimposed at the level of the small cold spot in the lower right quadrant. The count profile shows a distinct dip in counts corresponding to the cold spot.

Clinical example – Collimator star pattern

This ^{131}I image of a patient with metastatic thyroid tissue was acquired using a high energy collimator.

Fillable flood source - Air bubble

Characteristic routine QC images using a fillable flood source, ^{99m}Tc , 20% energy window.

Uniformity image. A discrete circular cold area is seen in the middle of the FOV. Visual inspection of the flood source revealed a large air bubble. The cold indentation at the top left edge of the FOV was also due to an air bubble.

Fillable flood source - Non-uniform mixing

Two different examples of a routine uniformity image using ^{99m}Tc in a fillable flood source. In each situation the ^{99m}Tc was injected into the water in the flood source and was left to disperse over a period of three-one hour.

Results: The non-uniformity shows that dispersion was insufficient to produce a homogeneous distribution of ^{99m}Tc , and that actual energy peak table plus. The right image also shows a small air bubble in the center of the FOV.

Myocardial Perfusion SPECT – With and without uniformity defect

Center of Rotation (COR) Offset

Reconstructed reconstruction of a point source with different COR errors. Acquisition: 37 on FOV with 1.5 mm, 64 x 64 matrix, 360° total angle of rotation, 64 projection angles, circular orbit. Reconstruction into transverse slices using a range filter and FBP. No correction was made for the COR offset error. Pixel size 3.81 mm.

- TL: 0 pixel offset (perfect slice)
- TM: 0.25 pixel offset error
- TR: 0.5 pixel offset error
- BL: 1 pixel offset error
- BM: 1.5 pixel offset error
- BR: 2 pixel offset error

Clinical SPECT brain perfusion – Effect of COR offset

Single head SPECT system, normal ^{99m}Tc MDP brain perfusion SPECT study, 360° total angle of rotation, 64 x 64 matrix. Data were collected and reconstructed by FBP into a single reconstructed transverse slice with four different COR offsets.

- TL: 0 pixel offset
- TR: 0.5 pixel offset
- BL: 1.0 pixel offset
- BR: 2.5 pixel offset

Whole body scan – Co57 versus Tc-99m energy window

Whole body scan of the skeleton, 90 MBq ^{99m}Tc, pinhole collimator, 1.018 collimator

Whole Body Scan – Contamination on handkerchief

Whole body scan three days after administration of a therapeutic amount of ¹³¹I iodide.

- I: Anterior view.
- II: Posterior view.

Gated SPECT acquisition – Problems due to heart arrhythmia

Gated SPECT data acquisition of myocardial perfusion (from a three head SPECT system) using a fixed acquisition time per projection of 45 s and fixed time bins for the gating; a time acceptance window of 82% of the average beat length (determined just prior to data acquisition); a 64 × 64 matrix and 60 projections.

- I: One projection (single coronal slice).
- II: Magnified from the profile (slice shown on the left).
- III: Compressed image from the same profile (slice).

Controller board failure

FIG 1.1. Reconstructed images of a water phantom demonstrating severe pixelation.

Faulty timing calibration

FIG 1.2. Motion artifacts in CT images due to faulty timing calibration.

FIG 1.3. Software interface for timing calibration.

Memory board failure

FIG 1.4. Memory usage and system performance over time.

FIG 1.5. Reconstructed images of a water phantom demonstrating severe pixelation.

Normalization

FIG. 3.13. 2-D data obtained from normalized data for a normal right mammogram acquisition.

FIG. 3.19. 2-D images from a breast compressed with a flat-top x-ray beam (harder spectrum) and displayed in two different color scales. If placed to match data for analysis, results for the detector response differences are more in keeping with the detector characteristics of the detector used to acquire each image (color-matched).

Faulty normalization

FIG. 3.15. (a) (Left) and (b) (Right) images obtained from a 2-D detector response image due to the presence of an object in the field of view.

FIG. 3.16. Region PET-CT image reconstructed with faulty normalization.

Scatter correction artifact

FIG. 3.20. PET scan acquisition with uncorrected PET scan, and corrected PET scan images of a 100-kg PET scan made from 100 to 1000 counts, showing scatter and randoms. The scan shows the scatter correction artifact in the form of the dark.

Contamination during flushing

FIG. 4.8. Excessive contamination seen on maximum intensity projection PET and localized to extra-vascular feet only on fused AC-PETCT images: (a) Maximum intensity projection; (b) and (c) non-attenuated coronal slices; (d) a transaxial slice through the contamination site.

Contamination post injection

FIG. 4.4. Whole body AC-PET image demonstrating a localized activity resulting from a spill into contamination of the patient's clothes following radiotracer administration. The localized uptake in the coronal view should also be noted (see Section 1.6) after attenuation correction.

Data entry errors and SUV analysis

TABLE 4.1. EFFECT OF VARIATION IN INPUT DATA (WEIGHT, UNITS, DOSE AND INJECTION TIME) ON MAXIMUM STANDARDIZED UPTAKE VALUE (SUV_{max}) MEASUREMENTS

Weight	Units	Dose (mCi/kg)	Injection time	SUV _{max}
100	kg	300	14:00	4.0
90	kg	300	14:00	4.4
110	kg	300	14:00	3.6
100	kg	400	14:00	5.3
100	kg	200	14:00	2.7

Insufficient Bed Overlap

FIG. 3.12. Image 3.12a: PET/CT scan of the chest. Image 3.12b: PET/CT scan of the chest. Image 3.12c: PET/CT scan of the chest. Image 3.12d: PET/CT scan of the chest.

FIG. 3.17. Image 3.17a: PET/CT scan of the chest. Image 3.17b: PET/CT scan of the chest. Image 3.17c: PET/CT scan of the chest. Image 3.17d: PET/CT scan of the chest.
